PLATFORM ADAPTATION AND BRING-UP GUIDE

This document is for software developers whose target is the NVIDIA® Jetson™ TX1 module. It describes how to port the NVIDIA® Tegra® Linux Driver Package and the U-Boot boot loader, from NVIDIA® Jetson™ TX1 Developer Kit to other hardware platforms.

For all of the procedures below, the NVIDIA® Tegra® Linux Driver Package (also known as L4T: Linux for Tegra) release includes code for the Jetson TX1 Developer Kit (P2371-2180) that can serve as an example.

BOARD NAMING

To support your board in L4T, you must choose a simple lower-case, alpha-numeric name for your board, possibly including dashes (-) or underscores (_) but containing no spaces, such as the following examples:

```
jetson-tx1  
p2371-2180  
beaver
```

The name you choose will appear in file names and path names in U-Boot and Linux kernel source code, user-visible device tree file names, and be exposed to the user via the U-Boot command prompt and various Linux kernel `/proc` files.

In this document, `<board>` represents your board name.

You must also choose a similarly-constructed vendor name. The same character set rules apply, such as the following example:

```
nvidia
```

In this document, <vendor> represents your vendor name.

Note: Do not simply re-use and modify the existing NVIDIA® Jetson™ TX1 Developer Kit code without choosing and using your own board name. If you do not use your own board name it will not be obvious to Jetson TX1 users whether modified source code supports the original Jetson TX1 Developer Kit carrier board or your board.

PLACEHOLDERS IN THE PORTING INSTRUCTIONS

The following sections refer to filenames and pathnames that contain these placeholders. Substitute an appropriate value for each placeholder when you enter the commands.

- <function> is a functional module name, which may be `power-tree`, `pinmux`, `sdmmc-drv`, `keys`, `comm` (WIFI/BT), `camera`, etc.
- <board> is a name you have chosen to represent your platform. For example, `p2597` is the name of the Jetson TX1 Developer Kit carrier board. Note that NVIDIA <board> names use lower case letters only.
- <som> is a System on a Module (SOM) board name, such as `2180`.
- <version> is a board version number, such as `a00`. Files for NVIDIA reference boards include a version number. Files for customer platforms need not include one.
- <vendor> is your organization's name, or the name of your board's vendor.
- <root> is the device that holds the platform's root file system. At present the only supported value is `emmc`.

PINMUX CHANGES

If your board schematic differs from that for Jetson™ TX1 Developer Kit carrier board, you must change the pinmux configuration applied by the software.

To define your board's pinmux configuration, you must obtain `Jetson_TX1_customer_pinmux_release.xlsm` from NVIDIA and customize it for the configuration of your board using the following procedures.

To customize the pinmux spreadsheet

1. Create a copy of the file with a name based on your board name, e.g. `<board>_pinmux.xlsm`.
2. Ensure that the new file is writable.
3. On a Windows PC, open the new file in Microsoft Excel.
4. If Microsoft Excel displays any warnings such as "PROTECTED VIEW" or "SECURITY WARNING," click Enable Editing or Enable Content, so that you can save your changes to the new file.

5. Rename the **Jetson TX1 Configuration** tab based on the name of your board:
 - Right-click on the **Jetson TX1 Configuration** tab at the bottom of the window.
 - Click the **Rename** menu option.
 - Type your board name into the tab, then press ENTER.
6. Modify columns AE through AO of the spreadsheet as required by the pinmux configuration for your board, based on the schematic.

Once the spreadsheet reflects the configuration you want, export the configuration data in a format that U-Boot and the Linux kernel can use.

EXPORTING PINMUX FOR U-BOOT

U-Boot uses a header file to define the pinmux configuration. This header file may be generated using the `tegra-pinmux-scripts` tool.

To customize `tegra-pinmux-scripts` for your board

1. Obtain `tegra-pinmux-scripts` by running the following commands on your Linux system:

```
$ git clone https://github.com/NVIDIA/tegra-pinmux-scripts.git
$ cd tegra-pinmux-scripts
```

2. In the `tegra-pinmux-scripts` directory, open `csv-to-board.py` in a text editor.
3. Locate the definition of the `supported_boards` data structure, at approximately line 50.
4. Add an entry for your board to the `supported_boards` data structure similar to the following example:

```
'<board>': {
    # <board>_pinmux.xlsm worksheet <board>
    'filename': 'csv/<board>.csv',
    'rsvd_0based': False,
},
```

5. Save the file and exit the editor.
6. Commit this change to your local Git repository:

```
$ git commit -a -m "Add support for <board>" -s
```

The `tegra-pinmux-scripts` read a CSV (Comma Separated Values) version of the pinmux spreadsheet as input.

To save the spreadsheet in CSV format

1. In Microsoft Excel, click the File tab.
2. On the File tab, click Save As.
3. From Save as type, choose CSV (MS-DOC) (*.csv).
4. Verify that the file name ends in .csv, but otherwise matches the file name in your changes to csv-to-board.py.
5. Click Save.
6. Copy the CSV file to the csv/ directory of tegra-pinmux-scripts on your Linux system.

To generate the U-Boot pinmux header file

1. Enter the following command in the tegra-pinmux-scripts directory to import the data into the tegra-pinmux-script internal format:

```
$ ./csv-to-board.py <board>
```

Optionally, use the `--csv <csv_file_name>` command line option to specify the CSV file to import. This allows you to copy the CSV file to an arbitrary location on your Linux system if you wish.

2. Enter the following command to generate the U-Boot pinmux header file:

```
$ ./board-to-uboot.py <board> > pinmux-config-<board>.h
```

Later, you will copy `pinmux-config-<board>.h` into the U-Boot source tree.

EXPORTING PINMUX FOR THE L4T LINUX KERNEL

The Linux kernel uses device tree files to define the pinmux configuration, which you can generate directly from the Excel spreadsheet.

To generate device tree files for your pinmux configuration

1. In the spreadsheet, click Generate DT.
2. Answer “yes” to the prompt asking whether you wish to generate the DT files and provide the name of your board when prompted.

The device tree files are saved in the same location as the Excel spreadsheet. After the file is generated, make sure that the file name matches what you use in your kernel code. Correct the file name if there is a mismatch. Later, you will copy the device tree files into the Linux kernel source tree.

PORTING U-BOOT

Perform the following actions in the U-Boot source code to add support for your board.

1. Copy `include/configs/jetson-p2371-2180.h` to `include/configs/<board>.h`.
2. Edit the set of enabled devices and features in `<board>.h` as appropriate for your board. For example, you must change the following:

```
#define CONFIG_TEGRA_BOARD_STRING      "NVIDIA P2371-2180"
```

3. Copy `arch/arm/dts/tegra210-p2371-2180.dts` to `arch/arm/dts/tegra210-<board>.dts`.
4. Edit the set of enabled devices and their parameters (e.g. GPIO and IRQ IDs) in `tegra210-<board>.dts` as appropriate for your board.

Nodes and properties might need to be added, removed, or edited.

Note:

U-Boot and the Linux kernel do not always use the exact same device tree schema (bindings) to represent the same data. Follow examples from U-Boot rather than from the Linux kernel.

5. Add `tegra210-<board>.dtb` to `arch/arm/dts/Makefile`.
6. Copy `configs/p2371-2180_defconfig` to `configs/<board>_defconfig`.
7. Edit `<board>_defconfig` to refer to your board name.
8. Edit `arch/arm/mach-tegra/tegra210/Kconfig` to add target config and `Kconfig`.
9. Copy the `board/nvidia/p2371-2180/` directory to `board/<vendor>/<board>/`.
10. Edit all of the files in `board/<vendor>/<board>/` to refer to your board name rather than the P2371-2180. The files in this directory contain many instances of the P2371-2180 board name.
11. Edit `board/<vendor>/<board>/MAINTAINERS` to provide the correct maintainer contact information for your board.
12. Edit `board/<vendor>/<board>/<board>.c` to provide the correct PMIC programming for your board, if required.
13. Copy the pinmux header you generated (`pinmux-config-<board>.h`) to the `board/<vendor>/<board>/` directory.

PORTING THE LINUX KERNEL

To port the kernel configuration code (the device tree) to your platform, modify one of the distributed configuration files to describe your platform's design.

The configuration files are in `arch/arm64/boot/dts/`. Their names have the form `tegra210-jetson-cv-base-<board>-<som>.dts`, where `<board>` refers to one of the NVIDIA reference boards, such as p2597.

NVIDIA recommends that you use this file and the files included, which describes the device tree of reference board P2597:

```
arch/arm64/boot/dts/tegra210-jetson-cv-base-p2597-2180-a00.dts
```

This device tree file includes many `.dtsi` files for various types of hardware. To configure the kernel to work on your platform, make copies of the `.dts` file and the `.dtsi` files it references, and modify the copies to correspond to your platform's design.

The following procedure will guide you through this process.

1. Copy the `.dts` file you have chosen to this location:

```
arch/arm64/boot/dts/tegra210-<board>.dts
```

2. From the `arch/arm64/boot/dts/tegra210-platforms/` directory, copy each file whose name has the form:

```
tegra210-jetson-cv-<function>-<board>-<som>-<version>.dtsi
```

Copy each file to:

```
arch/arm64/boot/dts/tegra210-platforms/tegra210-<board>-<function>.dtsi
```

You may rename the copies if that makes your work easier.

3. Edit your copy of the `.dts` file to refer to your copies of the `.dtsi` files.
4. Edit the set of enabled devices and their parameters (e.g. GPIO and IRQ IDs) in each copied file as appropriate for your board.

You may need to add, remove, or edit `.dtsi` file nodes and properties.

Note:

U-Boot and the Linux kernel do not always use the exact same device tree schema (bindings) to represent the same data. Follow examples from the Linux kernel rather than from U-Boot.

5. Replace the content of `tegra210-<board>-gpio.dtsi` and `tegra210-<board>-pinmux.dtsi` with the content you generated from the kernel pinmux files earlier.
6. Edit `arch/arm64/boot/dts/Makefile` to add an entry for your board, modeled after the existing Jetson™ TX1 entry.
7. Copy this file:

```
Linux_for_Tegra/bootloader/t210ref/p2371-2180/extlinux.conf.emmc
```

To this location:

```
Linux_for_Tegra/bootloader/t210ref/<board>-<som>/extlinux.conf.emmc
```

8. Edit the following statements in each copied file to refer to your board:

```
FDT /boot/tegra210-jetson-cv-base-p2597-2180-a00.dtb
```

9. Copy `Linux_for_Tegra/jetson-tx1.conf` to `Linux_for_Tegra/<board>.conf`.
10. Edit `SYSBOOTFILE` and `DTB_FILE` in `<board>.conf` to refer to your board.

Following are some examples of modifications that you may have to make.

Regulator

VDDIO of SDMMC1 comes from PMU LDO2. That section looks like this:

```
regulators {
    ldo2 {
        regulator-name = "vddio-sdmmc1";
    };
};
```

If there is any change for this power tree, this item should be changed.

PAD POWER DETECTION

Pad power on the T210 defaults to 3.3 V. Unlike some other Tegra models, the T210 does not have auto power detect cells. I/O pads that are powered at 1.8 V must be set manually in DTS to 1.8 V.

```
gpio {
    nvidia,io-pad-init-voltage = <IO_PAD_VOLTAGE_1_8V>;
};
```

GPIO

There are many GPIO configurations in different hardware modules. To change the GPIO setting, check the related device tree file.

For example, VDD of SDMMC is controlled by a GPIO pin (GPIO_PZ3). That is a power tree module, so the definition of this part is in:

```
tegra210-platforms/tegra210-jetson-cv-power-tree-p2597-2180-a00.dtsi
```

And looks like this:

```
en_vdd_sd: regulator@4 {
    gpio = <&gpio TEGRA_GPIO(Z, 3) 0>;
};
```

You can change this setting according to platform circuit.

Interrupt

For modules that make interrupt requests, the interrupt requests can also be declared in the .dts file.

For example, this file:

```
tegra210-platforms/tegra210-comms-p2530-0930.dtsi
```

Describes a WIFI interrupt like this:

```
bcmhdhd_wlan {
    compatible = "android,bcmhdhd_wlan";
    interrupt-parent = <&gpio>;
    interrupts = <TEGRA_GPIO(H, 2) 0x14>;
    wlan-pwr-gpio = <&gpio TEGRA_GPIO(H, 0) 0>;
    status = "okay";
};
```

This specifies GPIO_PH02 (same pin as WIFI_WAKE_AP) as the interrupt request pin from the WIFI module.

Key

The key is defined in:

```
tegra210-platforms/tegra210-keys-p2530-0930.dtsi
```

The power key is defined as:

```
power {
    label = "Power";
    gpios = <&gpio TEGRA_GPIO(X, 5) GPIO_ACTIVE_LOW>;
    linux,code = <KEY_POWER>;
    gpio-key,wakeup;
```

};

Note: This example is meant only to show how to define a key in a .dts file. 'Power key' is a special key, and *cannot* be changed.

For the detailed information about .dts files, refer to the documentation at [Documentation/devicetree/bindings](#) in the NVIDIA released Linux kernel source package.

USB LANE MAPPING

USB 3.0 has 4 super-speed ports. Not all can be used in the same implementation because of lane sharing between PCIE, SATA, and XUSB. Possible combinations for USB 3.0 are shown in the tables below.

	Jetson TX1 Pin Names	PEX1	PEX_RFU	PEX2	USB_SS1	PEX0	USB_SS0	NA	SATA
	Tegra X1 Lanes	Lane 0	Lane 1	Lane 2	Lane 3	Lane 4	Lane 5	Lane 6	SATA
Use Case	1 (Carrier)	PCle#1_0	PCle#0_3	PCle#0_2	PCle#0_1	PCle#0_0	USB_SS#1	USB_SS#0 On-Jetson TX1 For LAN	SATA
	2	PCle#1_0	PCle#0_3	PCle#0_2	PCle#0_1	PCle#0_0	USB_SS#1		USB_SS#3
	3	USB_SS#2	PCle#0_3	PCle#0_2	PCle#0_1	PCle#0_0	USB_SS#1		SATA
	4	PCle#1_0	-	-	USB_SS#2	PCle#0_0	USB_SS#1		SATA
	5	PCle#1_0	-	-	USB_SS#2	PCle#0_0	USB_SS#1		USB_SS#3

Use Case	Available Outputs from Jetson TX1		
	USB 3.0	PCle	SATA
1 (Carrier)	1	1x1 + 1x4	1
2	2	1x1 + 1x4	0
3	2	1x4	1
4	2	2x1	1
5	3	2x1	0

The customer pinmux spreadsheet contains all Tegra X1 pin names and ball names for determining which ball names are used for the super-speed connector, and the pinmux configuration of those pins.

An example configuration is given in section 6.1 of the *Jetson TX1 OEM Product Design Guide*. Each external super-speed connector has both USB 2.0 (DP, DN) and USB 3.0 lines (TX+/-, RX+/-) linked to the connector. A possible exception is where a fixed, on-board device is connected to super-speed lines and does not require USB 2.0 compatibility.

Required Device Tree Changes

The following device tree properties must change when USB configuration changes.

- `XHCI: nvidia,portmap`: List of all ports (2.0/3.0) available for the XUSB controller
 - Each bit represents port and bit is set for ports controlled by XUSB.
 - Bits 0-7 represent USB 3.0 ports with Port 0 on the LSB.
 - Bits 8-15 represent USB2.0 ports with Port 0 on bit 8.
 - Bits 16-23 represent HSIC ports with Port 0 on bit 16.
 - Example: `<0x0e02>` represents USB3.0 Port1 and USB2.0 Port 1,2,3 are enabled.
- `PADCTL: nvidia,ss_portmap`: Mapping between USB 2.0 port (lines) and USB 3.0 port (lines) available on a single connector.
 - Each nibble represents a USB 3.0 port starting from LSB. The matching USB 2.0 port has must be entered. Enter 7 if the super-speed port is not in use or not available.
 - For example, `<0x7730>` represents following mapping.
 - `ssport0-usb2port0`.
 - `ssport1-usb2port3`.
 - `ssport2-disabled`.
 - `ssport3-disabled`.
 - USB 3.0 standalone ports without a USB 2.0 port require mapping to a USB 2.0 port that is a valid host port. Two USB 3.0 ports can be mapped to a single USB 2.0 port with the same role and may not represent the end-connector mapping, in the stand-alone ports case.
- `nvidia,lane_owner` : PEX/HSIO Lanes used by USB3.0 ports.
 - Each nibble represents a USB 3.0 port starting from the LSB. A matching lane number must be entered. Enter `0xF` if the port is not in use or no lane is mapped.
 - For example `<0xFF56>` represents the following mapping:
 - `ssport0-lane6`
 - `ssport1-lane5`
 - `ssport2-not in use`
 - `ssport3-not in use`

Example 1

A case where USB 2.0 port 3 and USB 3.0 port 2 are linked to an external connector on a carrier board matches use case 3 in possible mappings of super-speed ports. In that case the USB_SS#2 port is using Lane 0 (USB_SS1 pins, ball names E41, E42, H41, H42). USB 2.0 port 3 (ball names B42, B43) is mapped to an external connector (the default configuration uses these lines for M2.Key). PCIe x1 should be disabled, USB_SS#2 port should be enabled and lane mapping should now indicate that lane 0 is in use by USB.

In this example, the following device tree properties must be changed:

nvidia,ss_portmap

Super-speed port 2 must be enabled. This portmap should match USB 3.0 and USB 2.0 lines on the same connector. For a standalone USB 3.0 port, any valid USB 2.0 port is sufficient. In this case USB 2.0 port 3 is matched with USB 3.0 port 2, so the value changes from <0x7721> to <0x7321>.

nvidia,portmap

Control super-speed port 2 with XHCI by replacing <0x0e03> with <0x0e07>.

nvidia,lane_owner

The lane owner for lane 0 is XUSB and is used by super-speed port 2. The property value of <0xff56> becomes <0xf056>.

nvidia,lane-map

This property indicates PEX lanes are available in the PCIe module and how they are configured. Because lane 0 (PEX1) is in use by USB, the lane map is modified from <0x14> to <0x4>.

Overall device tree properties patch in this case are as follows:

```

    pcie-controller {
[...]
-           nvidia,lane-map = <0x14>;
+           nvidia,lane-map = <0x4>;
[...]
    };
    xusb_pad_ctl: xusb_padctl { /* Put common control config here
*/
[...]
-           nvidia,ss_portmap = <0x21>;
-           nvidia,lane_owner = <0xff56>; /* Use 0xF to
disable lane assign */
+           nvidia,ss_portmap = <0x321>;
+           nvidia,lane_owner = <0xf056>; /* Use 0xF to
disable lane assign */

```

```

+                nvidia, lane-map = <0x4>;
[... ]
    };
    xusb@70090000 {
[... ]
-                nvidia, portmap = <0x0e03>;
+                nvidia, portmap = <0x0e07>;
[... ]
    };

```

Example 2

USB 3.0 port 2 is used as a standalone port using lane 3. This matches use case 4/5 in possible mappings of super speed ports. USB_SS#2 port is using lane 3 (PEX1 pins, ball names G42, G43, D42, D43). PCIe configuration changes from 1x1+1x4 to 1x1+1x1. USB_SS#2 is enabled and lane mapping indicates that lane 3 is in use by USB.

The following device tree properties must change:

nvidia,ss_portmap

Super-speed port 2 is enabled. This portmap should match USB 3.0 and USB 2.0 lines on the same connector. For a standalone USB 3.0 port, specify any valid USB 2.0 port. In this case a USB 2.0 stand-alone port matches a valid USB 2.0 port. This value changes from <0x7721> to <0x7221>.

nvidia,portmap

Control super-speed port 2 with XHCI by replacing <0x0e03> with <0x0e07>.

nvidia, lane_owner

The lane owner for lane 3 is XUSB and is used by super-speed port 2. The property value of <0xff56> becomes <0xf356>.

nvidia, lane-map

This property indicates PEX lanes are available in the PCIe module and how they are configured. Because lane 3 (USB_SS1) is in use by USB, the lane map is modified from <0x14> to <0x11>.

Overall device tree properties patch for above case would look like:

```

    pcie-controller {
-                nvidia, lane-map = <0x14>;
+                nvidia, lane-map = <0x12>;
[... ]
    };

```

```

xusb_pad_ctl: xusb_padctl { /* Put common control config here
*/
[...]
```

```

-             nvidia,ss_portmap = <0x7721>;
-             nvidia,lane_owner = <0xff56>; /* Use 0xF to
disable lane assign */
-             nvidia,lane-map = <0x14>;
+             nvidia,ss_portmap = <0x7221>;
+             nvidia,lane_owner = <0xf356>; /* Use 0xF to
disable lane assign */
+             nvidia,lane-map = <0x11>;
[...]
```

```

    };
    xusb@70090000 {
[...]
```

```

-             nvidia,portmap = <0x0e03>;
+             nvidia,portmap = <0x0e07>;
            nvidia,common_padctl = <&xusb_pad_ctl>;
[...]
```

```

    };
};
```

OTHER CONSIDERATIONS WHEN PORTING

This section describes other considerations and recommendations to consider when porting.

To flash the build image

- When flashing the build image, use your specific board name:

```
$ sudo ./flash.sh <board>-<som> mmcblk0p1
```

To flash with BOARDID if the design does not use EEPROM

BOARDID is either passed using an XML file during flashing or is read from EEPROM. The flashing software uses the BOARDID from the XML file if provided; otherwise it uses the EEPROM value. The file `board_config_p2597-devkit.xml`, shown below, illustrates the XML file format.

```

<?xml version="1.0"?>
<!-- Nvidia Tegra board info configuration file -->
<board_configs>
  <board type="proc" id="2180" sku="1000" fab="0" />
  <board type="display" id="0000" sku="0000"/>
  <board type="pmu" id="2180" sku="0000" />
</board_configs>
```

This flashing config file `p2371-2180-devkit.conf` passes the name of the XML file as an option:

```
BCFFILE="bootloader/${target_board}/cfg/board_config_p2597-devkit.xml";
```

The file contains the processor module ID (`type="proc"`), display board ID (`type="display"`), and power management unit ID (`type="pmu"`). Since the processor and PMU are on the same module in the development kit, they have the same ID.

If you add new values for the `board` tag's `id` property, you must add them to the list of valid values in `nvtboot`.

To change the UART port to UARTA

1. In `Linux_for_Tegra/<board>.conf`, modify the ODMDATA assignment:

```
ODMDATA=0x60084000;
```

2. In the U-Boot boot loader, locate the following lines in `/include/configs/jetson-tx1.h`:

```
#define CONFIG_TEGRA_ENABLE_UARTD
#define CONFIG_SYS_NS16550_COM1          NV_PA_APB_UARTD_BASE
```

3. Modify those lines to specify UARTA:

```
#define CONFIG_TEGRA_ENABLE_UARTA
#define CONFIG_SYS_NS16550_COM1          NV_PA_APB_UARTA_BASE
```

4. In the kernel, modify the `debug_uartport` assignment:

```
debug_uartport=1sport,0
```

HARDWARE BRING-UP CHECKLIST

This section provides a checklist for the platform hardware bring-up process.

Before Power-On

Make sure that the Jetson TX1 is connected to the BTB connector correctly and	<input type="checkbox"/>
---	--------------------------

securely.	
Verify that power supplies are not shorted to ground or to other power supplies.	<input type="checkbox"/>

Initial Power-On

Verify that VDD_IN from carrier board is in the 6 V to 19 V range.	<input type="checkbox"/>
Verify that CARRIER_WR_ON goes to HIGH when power is turned on.	<input type="checkbox"/>
Verify that system can enter force recovery.	<input type="checkbox"/>

Initial Software Flashing

Verify that system can be flashed with TegraFlash.	<input type="checkbox"/>
Verify that TegraBoot and U-boot run to completion by checking log output.	<input type="checkbox"/>
Verify that OS runs to desktop.	<input type="checkbox"/>
Verify that any UARTs intended for debugging are enabled and functional.	<input type="checkbox"/>

Power

Verify that all supplies required on at power-on are enabled appropriately.	<input type="checkbox"/>
Verify that all supplies required off at power-on are not enabled initially.	<input type="checkbox"/>
Verify that each controllable supply can be enabled and disabled, and different voltage levels can be set if applicable.	<input type="checkbox"/>
Verify that carrier board power-on sequence starts after CARRIER_PWR_ON signal is asserted.	<input type="checkbox"/>

Power Optimization

Capture CPU PWR Request entering and exiting Suspend (LP1) and Deep Sleep (LP0). Ensure that CPU PWR Request and associated power rail sequence meets Tegra Data Sheet requirements.	<input type="checkbox"/>
Verify that all rails which must be OFF in Deep Sleep (LP0) are OFF.	<input type="checkbox"/>
Verify that all rails which must be ON in Deep Sleep (LP0) are ON.	<input type="checkbox"/>
Verify that required rails are back and at correct voltage under hardware control exiting Deep Sleep (LP0).	<input type="checkbox"/>

USB 2.0 PHY

Verify that USB0 supports USB Recovery (device mode).	<input type="checkbox"/>
Verify that USB0 device mode works with intended peripheral types, if supported.	<input type="checkbox"/>

Verify USB0, USB1 and or USB2 Host mode, if implemented.	<input type="checkbox"/>
Verify USB0 Device/Host detection, if supported.	<input type="checkbox"/>
Verify that USB PHYs go to lowest power mode when not used or when the system is in low power mode.	<input type="checkbox"/>
Verify that AVDD_USB and AVDD_PLL_UTMIP are off during Deep Sleep (LP0).	<input type="checkbox"/>
Capture USB0_D+/D- signals at both ends of link (connector and test points near Tegra).	<input type="checkbox"/>
Capture USB2_D+/D- signals at both ends of link (connector and test points near Tegra).	<input type="checkbox"/>
Using USB-IF procedures, verify that signals meet requirements (correct eye height/width, etc.).	<input type="checkbox"/>
If USB signals do not meet requirements, use the <i>Tegra USB Tuning Guide</i> to adjust settings until requirements are met.	<input type="checkbox"/>

USB 3.0

Verify USB 3.0 Host mode.	<input type="checkbox"/>
Verify USB 3.0 Device mode, if enabled.	<input type="checkbox"/>
Verify that the USB 3.0 interface goes to the lowest power mode when not used or when the system is in low power mode.	<input type="checkbox"/>

HDMI

Verify that HDMI-compatible display works at 1080p.	<input type="checkbox"/>
Verify that display is detected properly (HPD).	<input type="checkbox"/>
Verify that HDMI reads and writes to the display using DDC interface.	<input type="checkbox"/>
Verify that HDMI related rails are powered off when not used or system is in Deep Sleep (LP0) or Suspend (LP1).	<input type="checkbox"/>
Capture HDMI signals at the connector (using appropriate test fixture and termination).	<input type="checkbox"/>
Verify that signal quality is acceptable (meets EYE diagram, etc.). Consult <i>Tegra HDMI Tuning Guide</i> for details.	<input type="checkbox"/>
If HDMI signals do not meet requirements, use the <i>Tegra HDMI Tuning Guide</i> to adjust settings until requirements are met.	<input type="checkbox"/>

Audio

Verify reads and writes on I2C interface used for Audio Codec.	<input type="checkbox"/>
Verify that playback works properly on speakers, headphones, and headset.	<input type="checkbox"/>
Verify that capture works properly: Sound is recorded from microphone/headset if supported.	<input type="checkbox"/>
Verify that tones, voice, etc. can be heard from speakers or headphones/headset.	<input type="checkbox"/>

Verify that Audio Codec goes to lowest power mode when not in use or system enters low power mode.	<input type="checkbox"/>
Capture signals at receiver end of link, if accessible, for each I2S I/FT used.	<input type="checkbox"/>
Verify that signal quality is acceptable. Look for excessive over/undershoot and glitches on signal edges.	<input type="checkbox"/>

UART

Verify that Tegra TX/RX/CTS/RTS connects to device RX/TX/RTS/CTS for each UART used.	<input type="checkbox"/>
Verify that signal quality is acceptable. Look for excessive over/undershoot and glitches on signal edges.	<input type="checkbox"/>

SD Card (SDMMC1)

Verify proper connectivity by setting Tegra pins to GPIOs, if necessary, to debug.	<input type="checkbox"/>
Verify that basic SD commands operate properly.	<input type="checkbox"/>
Verify reads and writes for a variety of SD Cards.	<input type="checkbox"/>
Verify that SD Card insertion detection works and wakes system, if supported.	<input type="checkbox"/>
Verify that SD Card Write Protect works, if implemented.	<input type="checkbox"/>
Verify that SD Card goes to low power mode or rails are powered off when not used or in low power system state.	<input type="checkbox"/>
Verify that signal quality is acceptable when probed at receiver end (socket or test points near BTB connector or both for bidirectional signals). Look for excessive over/undershoot and glitches on signal edges and abnormal Clock duty cycle.	<input type="checkbox"/>

Sensors I2C: General

Verify that addresses of all I2C devices appear correctly, and no unknown ghost devices appear.	<input type="checkbox"/>
Verify that signal quality is acceptable, including rise times of signals, when probed at BTB connector and devices.	<input type="checkbox"/>

Sensors I2C: Touch Screen (Optional)

Verify that Reads/Writes on I2C or SPI to Touch Screen controller are functional (reading device ID or a similar register is successful).	<input type="checkbox"/>
Verify that interrupts are generated properly.	<input type="checkbox"/>
Verify functionality of Touch Screen.	<input type="checkbox"/>
Verify that Touch Screen Controller goes to lowest power mode when not used, or system is in low power state.	<input type="checkbox"/>

PEX (Optional)

Verify proper connectivity by checking lanes.	<input type="checkbox"/>
Verify that any implemented PEX interfaces transition to the lowest power state in Deep Sleep (LP0) and Suspend (LP1).	<input type="checkbox"/>
Verify that signal quality is acceptable when probed at receiver end of link near Tegra and device. Look for excessive over/ undershoot and glitches on signal edges.	<input type="checkbox"/>

SATA (Optional)

Verify proper connectivity by checking diff lines.	<input type="checkbox"/>
Verify that any implemented SATA interfaces transition to the lowest power state in Deep Sleep (LP0) and Suspend (LP1).	<input type="checkbox"/>
Verify that signal quality is acceptable when probed at receiver end of link near Tegra and device. Look for excessive over/ undershoot and glitches on signal edges.	<input type="checkbox"/>

Embedded Display(s) (Optional)

Verify that I2C or other control interface is able to perform writes/reads to display.	<input type="checkbox"/>
Verify that each embedded display shows correct colors.	<input type="checkbox"/>
Verify that each embedded display's backlight is enabled when in normal display mode.	<input type="checkbox"/>
Verify that each embedded display's backlight brightness can be adjusted properly.	<input type="checkbox"/>
Verify that each embedded display's backlight is disabled when in a low power mode.	<input type="checkbox"/>
Verify that each embedded display (and any display bridge) transitions to the lowest power state in Deep Sleep (LP0) and Suspend (LP1).	<input type="checkbox"/>
Verify that power-on/off sequencing of rails associated with each display meets manufacturer's requirements.	<input type="checkbox"/>
Verify DSI, LVDS or eDP timing (see <i>Tegra DC and DSI Debugging Guide</i> for details on how and what to verify).	<input type="checkbox"/>
Probe DSI, LVDS or eDP signals near panel driver, or at connector/test points if access to driver is not possible, and verify that signal quality is acceptable. Look for excessive over/undershoot and glitches on signal edges.	<input type="checkbox"/>

Imager(s) (Optional)

Verify that I2C interface writes/reads work to all cameras.	<input type="checkbox"/>
Verify that preview displays properly for all cameras.	<input type="checkbox"/>
Verify that still capture works on all cameras.	<input type="checkbox"/>
Verify that video capture works on all cameras.	<input type="checkbox"/>
Verify that all flashes operate properly.	<input type="checkbox"/>

Verify that any available autofocus mechanism functions properly.	<input type="checkbox"/>
Verify that privacy LED operates properly, if implemented.	<input type="checkbox"/>
Verify that cameras and related circuitry enter lowest power mode when not used or system is in a low power mode.	<input type="checkbox"/>
Verify that power-on/off sequencing of rails associated with imager module meets manufacturer's requirements.	<input type="checkbox"/>
Probe MCLK output at recommended test points, and verify that signal quality is acceptable. Look for excessive over/undershoot and glitches on signal edges.	<input type="checkbox"/>

SOFTWARE BRING-UP CHECKLIST

This section provides a checklist for the software bring-up process.

Preparation

Verify Board BCT.	<input type="checkbox"/>
Verify operation eMMC with the NVIDIA Diagnostic Tool.	<input type="checkbox"/>
Obtain board schematics and component data sheets.	<input type="checkbox"/>
Verify power tree.	<input type="checkbox"/>
Review board pinmux.	<input type="checkbox"/>

Bring-up Hardware Validation

Power and Reset Sequence, Power Rail Check	<input type="checkbox"/>
Recovery Mode	<input type="checkbox"/>
NvTest (Tegra MODS) DDR, eMMC, CPU	<input type="checkbox"/>
JTAG connection check	<input type="checkbox"/>

U-Boot Port and Boot Validation

TegraFlash	<input type="checkbox"/>
UART output	<input type="checkbox"/>
KBD connection	<input type="checkbox"/>
Board config/PMIC regulator config/Pinmux/Review device tree	<input type="checkbox"/>
Verify FS support/Config boot scripts (bootcmd)	<input type="checkbox"/>
Boot to U-boot	<input type="checkbox"/>
Boot to kernel	<input type="checkbox"/>
Boot to kernel command line or custom desktop	<input type="checkbox"/>

Kernel and Peripherals, Port and Validation

Device tree review, Pinmux, GPIO, Wake pins	<input type="checkbox"/>
PMU and regulator drivers	<input type="checkbox"/>
Display/HDMI	<input type="checkbox"/>
Audio codec	<input type="checkbox"/>
Microphone and speaker	<input type="checkbox"/>
USB	<input type="checkbox"/>
SD card	<input type="checkbox"/>
Thermal Sensor	<input type="checkbox"/>
EMC DFS table	<input type="checkbox"/>
Ethernet	<input type="checkbox"/>
SATA	<input type="checkbox"/>
PCIe	<input type="checkbox"/>

System Power and Clocks

CPU/CORE/GPU DVFS	<input type="checkbox"/>
EMC DFS table	<input type="checkbox"/>
CPU/CORE EDP	<input type="checkbox"/>
GPU EDP	<input type="checkbox"/>
System EDP (Contain Current monitor & Voltage comparator)	<input type="checkbox"/>
Power Off	<input type="checkbox"/>
LP0 (optional)	<input type="checkbox"/>
CPU power down (LP2)	<input type="checkbox"/>
BCT, Full-speed	<input type="checkbox"/>

Notice

ALL NVIDIA DESIGN SPECIFICATIONS, REFERENCE BOARDS, FILES, DRAWINGS, DIAGNOSTICS, LISTS, AND OTHER DOCUMENTS (TOGETHER AND SEPARATELY, "MATERIALS") ARE BEING PROVIDED "AS IS."
